

FoodyAI – AI Food Adviser and Weekly Meal Organizer

Group: גלעד, וולוס, אורן, דוד

Problem Description

People often struggle to plan meals for an entire week while considering preferences, dietary restrictions, available ingredients, budget, and personal schedules. Fixed meal plans are also difficult to maintain when a meal is skipped, replaced, or eaten on a different day.

Expected Users

- Individuals and families
- Students and people planning meals in advance
- Users with dietary preferences, allergies, or restrictions
- Users who want help organizing ingredients and weekly meals

Solution

FoodyAI is an AI-powered food adviser and weekly meal-planning application. Users describe their goals, preferences, restrictions, available ingredients, and weekly schedule through a conversation. The system creates an editable weekly meal plan and allows users to track what they ate, skipped, replaced, or still need to prepare.

Core Capabilities

- AI chat for creating and updating a personalized meal plan
- User preferences, allergies, restrictions, ingredients, and schedule settings
- Weekly plan divided by day and meal type
- Meal statuses such as planned, eaten, skipped, and replaced
- Editing or regenerating one meal, one day, or the full week
- Favorite meals and meal history
- Optional shopping-list and nutrition-information generation

Main Pages / Views

- AI adviser chat page
- User preferences and restrictions page
- Weekly calendar / meal-plan page
- Daily meal details page
- Favorites and history page
- Optional shopping-list page

Hackathon Notes

The first version should focus on planning and organization rather than medical advice. Dietary restrictions should be treated as user-provided constraints, and generated meals should remain editable. Shopping lists and nutritional calculations can be added after the core workflow is complete.
